

## Kelly's Painting Style Description

### Overall Style

- We wanted to stick to an easy color scheme that wouldn't be too much on the eyes and we found that the greens matched well with the photos we wanted for the main page, so added that to the black and white for our color scheme
- The navigation has a cool hover effect and we made sure we could tell which page we were on anywhere in the site

### Main Page

- We liked using the slideshow on the main page since it seemed to add to what the site is about

### Services Page

- We added style to our table, but removed our original hover effects after our first round of testing because users expected them to lead to a new link/page.

### Portfolio Page

- We used position and z-index to put text over our images
- The images in the top row link to different sections of the page
- We also styled this page to resemble a paint swatch that you can find at hardware stores

### Estimate Page

- We changed up the style of a typical form with all the fieldsets to make it look more condensed and so that there would be less excess white space on the page (used display: inline-block instead of floats so that it would look more centered)
- We added pseudo-classes that act as a kind of validators for the text boxes on the page (although we still added the php for the required validation on our form)
- We edited the "get your free estimate today" text by using ">" instead of adding a class/id
- We styled the listbox so it didn't look like an average listbox

### Contact Page

- We added style and a hover effect to the table
